18:29:04 From Scott Hampton-Visalia, California:  
Talc, or talcum, is a clay mineral composed of hydrated magnesium silicate, with the chemical formula  $Mg_3Si_4O_{10}(OH)_2$ . Talc in powdered form, often combined with corn starch, is used as baby powder. This mineral is used as a thickening agent and lubricant. It is an ingredient in ceramics, paints, and roofing material. It is a main ingredient in many cosmetics. It occurs as foliated to fibrous masses, and in an exceptionally rare crystal form. It has a perfect basal cleavage and an uneven flat fracture, and it is foliated with a two-dimensional platy form.
